International Advanced Level
Paper 3: Applications of Psychology

Monday 4 June 2018 – Afternoon
Time: 1 hour 30 minutes

Paper Reference

WPS03/01

You do not need any other materials.

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **ALL** questions in Section A, and **ALL** questions from **EITHER** Option 1 criminological psychology **OR** Option 2 health psychology.
- Answer the questions in the spaces provided
– *there may be more space than you need.*

Information

- The total mark for this paper is 64.
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*
- The list of formulae and statistical tables are printed at the start of this paper.
- Candidates may use a calculator.

Advice

- Read each question carefully before you start to answer it.
- Check your answers if you have time at the end.

70	79.72	85.53	90.53	95.02	100.43	112.32

The calculated value must be equal to or exceed the critical value in this table for significance to be shown.

Wilcoxon Signed Ranks test process

- Calculate the difference between two scores by taking one from the other
- Rank the differences giving the smallest difference Rank 1

Note: do not rank any differences of 0 and when adding the number of scores, do not count those with a difference of 0, and ignore the signs when calculating the difference

- Add up the ranks for positive differences
- Add up the ranks for negative differences
- T is the figure that is the smallest when the ranks are totalled (may be positive or negative)
- N is the number of scores left, ignore those with 0 difference

Critical values for the Wilcoxon Signed Ranks test

	Level of significance for a one-tailed test		
	0.05	0.025	0.01
	Level of significance for a two-tailed test		
<i>N</i>	0.1	0.05	0.02
N=5	0	-	-
6	2	0	-
7	3	2	0
8	5	3	1
9	8	5	3
10	11	8	5
11	13	10	7
12	17	13	9

The calculated value must be equal to or less than the critical value in this table for significance to be shown.

SECTION A

DEVELOPMENTAL PSYCHOLOGY

Answer ALL questions. Write your answers in the spaces provided.

- 1 Marianne conducted research into the stages of language development in children aged between 2 and 5 years old. She selected 7 participants from each of the following age groups: 2-year-olds, 3-year-olds, 4-year-olds and 5-year-olds.

Marianne visited each participant once and gathered data about the number of words the children spoke in sentences, and the level of grammatical accuracy in their sentence structure.

She compared her data across each age group to determine how language develops in children aged between 2 and 5 years old.

- (a) Identify the research method Marianne used to determine how language developed across the age groups.

(1)

.....

.....

- (b) Suggest **one** reason why Marianne chose not to include children under the age of 12 months old in her research about the development of language.

(2)

.....

.....

.....

- (c) Marianne used an opportunity sample of children from a single village.

Justify how Marianne could improve the generalisability of her study.

(2)

.....

(Total for Question 1 = 5 marks)

2 Ling is using a clinical interview method to investigate the cognitive processes of 26 children aged 3 years old. She decides to study each child individually.

Ling presents each child with the same conservation of number task.

She shows each child two rows of buttons. One row appears longer than the other, as shown in **Figure 1**. Ling asks each child to explain which row has the most buttons and then asks further questions based on their responses.

Figure 1

(a) Of the 26 children, 23 answered incorrectly, saying that there were more buttons in the second row.

Calculate the percentage of children who correctly answered that the number of buttons was the same for both rows in **Figure 1**.

You **must** give your answer to two decimal places.

(1)

Space for calculations

Percentage of children giving correct answer

(b) Explain **one** strength and **one** weakness of Ling using a clinical interview method in this study with 3-year-olds.

- 3 David gathered data to find out whether there is a relationship between emotional recognition and the age of a child.

Children aged 7 to 11 years old were each given 12 picture cards showing facial expressions of different emotions. They were also given 12 cards that named the emotion for each facial expression card.

David asked the children to match the picture card to the correct named emotion card.

His results are shown in **Figure 2**.

A scatter diagram to show the correlation between the age of a child and the number of correctly matched cards

9 Mollie is a psychologist in a local prison. She is developing a psychological (case) formulation to help understand the offending behaviour of one of the prisoners.

The prisoner was charged with committing a violent act towards a stranger. He was in care as a baby, being separated from his mother at 6 months old, and has a history of drug and alcohol misuse. This is his second aggressive criminal offence.

Explain **two** reasons why Mollie would develop a psychological (case) formulation of the prisoner.
